A Structure: triad, interdisciplinary ring, civilisational shell

G **GERAK | mobility**
travel, trade, pilgrimage

K **KESENJANGAN | inequity**
who is susceptible, who is reached

E **EKSPOSUR | exposure density**
crowding, livestock, vectors

B **BERITA & BIAS | information disorder**
misinformation, fallacies, trust

Dashed arrows: pathways through which pathogens reach the core when the shell fractures

B From fractures to transmission

B multiplies every modifiable term (adherence, uptake, testing)

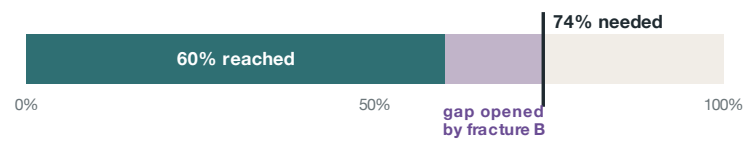

$$R_t = \beta \times c \times D \times S/N \mid + \imath$$

per-contact transmission (A) · contact rate · infectious duration · susceptible fraction · importation (cases added)

	Fracture and parameter	Example routine indicators
G	**Mobility** $\imath$, spatial coupling	passenger flows, mobility indices
E	**Exposure density** c	floor area per person, room volume
K	**Inequity** S/N, D, CFR	coverage by quintile, diagnostic delay
B	**Information disorder** multiplier on c, D, S/N, $\imath$	belief in misinformation, trust

Proposition 4: information disorder defeats an efficacious vaccine

R0 = 3, vaccine efficacy 90%, critical coverage = (1 - 1/R0) / 0.9 = 74%

Because the terms multiply, fractures compound: narrowing several fractures together reaches the threshold with a smaller reduction in each (67% in one term or 31% in each of three).
